MacDermid Enthone and OEM's: Driving The Innovation Process

Removing oil, grease and general soils from metals such as aluminum, brass, magnesium and steel is a critical step in any surface treatment process. Additionally the **Metex** and **Isoprep** range contains products to remove oxide and activate metallic surfaces. **Iridite NCP** and **Iridite 14-2** provide excellent corrosion resistance to aluminum alloys, whereas **Iridite 15** is the recommended conversion coating for magnesium. **NiKlad** Electroless nickel coatings improve characteristics such as appearance, corrosion / wear resistance and magnetic properties. **ChromKlad** hardchromium provides both exceptional wear and abrasion resistance as well as retaining oil lubricating films. **Enviralloy** Ni Zinc-nickel gives exceptional sacrificial corrosion resistance and the coating is compatible with light metals such as aluminum and magnesium.
